

SESSION 7

Final Technical Report + AI Review Agent

Compile all session reports into one final product specification package, then use NotebookLM as a reviewer to detect gaps and guide corrections.

FINAL INTEGRATION

AI REVIEW

CORRECTIONS

What happens in Session 7

This is not a new section. It is the final integration and review session.

Compile

Merge Sessions 2–6 into one coherent technical report. Remove repetition, unify language and keep only relevant evidence.

Review

Use NotebookLM as an AI technical reviewer to detect missing sections, weak evidence and inconsistent information.

Correct

Apply changes, update tables and prepare the final PDF with a correction checklist.

Session 7 deliverables

What each team must submit by the end of the final integration process.

Deliverable	What it includes
Final Technical Report	One complete PDF with all corrected sections from Sessions 2–6.
AI Review Output	NotebookLM review table or screenshots showing completeness, consistency and missing information.
Correction Checklist	List of changes applied after AI review.
Evidence Folder	Images, renders, drawings, BOM, diagrams, test photos, references or links.

Goal: the report should be ready to evaluate as a professional product specification package.

Final technical report structure

Use previous sessions as building blocks.

From Sessions 2–3

- Project overview
- User + context
- Problem statement
- Value proposition
- Requirements table
- Materials + CMF
- Production process direction

From Sessions 4–6

- Product architecture
- Parts breakdown + BOM
- Use sequence + ergonomics
- Validation plan
- Production manual
- Sustainability + life cycle
- References + missing information

Compilation workflow

How to turn separate session files into one final report.

1 Create one master document

Open Google Docs, Word, Notion or Canva and create the final report structure.

2 Paste the best version of each section

Do not paste everything. Select the strongest content and remove repeated paragraphs.

3 Unify names, materials and numbers

Check product name, dimensions, materials, parts, costs, processes and user profile.

4 Add evidence and captions

Every important claim should have a drawing, image, test, table, source or caption.

Final output: one PDF that reads like a single professional report, not a folder of partial tasks.

Build an AI review agent in NotebookLM

The AI reviewer checks the final report against the course requirements.

1. Create / open project notebook

Use the team notebook or create a final-review notebook.

2. Upload sources

Session 2, 3, 4, 5, 6 reports + final compiled report + evidence.

3. Ask for review

Use the reviewer prompt to create a table of complete, partial and missing sections.

4. Apply corrections

Edit the final report, then document what changed.

Important: NotebookLM should review your sources. It should not invent missing specifications.

AI reviewer prompt

Adapt this prompt in NotebookLM.

Act as an industrial design technical report reviewer.

Using only the uploaded sources, review our Final Technical Product Specification Report.

Create a table with: Section, Status, What works well, What is missing, What needs correction and Priority.

Check consistency in: product name, dimensions, materials, components, BOM, processes, visual identity, user profile, tests and evidence.

Do not invent information. Mark gaps as missing, needs evidence, needs measurement or needs testing.

At the end, list the 5 most urgent corrections and the sections ready for final submission.

Final report quality check

Before submitting, every team should verify these items.

Content

- Overview is clear
- Requirements have evidence
- Materials match BOM
- Drawings and parts are labeled

Technical logic

- Production process is realistic
- Assembly sequence is clear
- Validation tests are measurable
- Risks are identified

Presentation

- Images have captions
- Tables are readable
- No repeated content
- References are included
