

SESSION 6

Production Manual, Sustainability and Digital Output

How the product is made, assembled, maintained, and presented as a website or app prototype.

Production report fragment

Digital report output

Why this session matters

From technical decisions to a production-ready story.

Before

Requirements, materials, drawings, BOM and validation plan exist as separate sections.

Today

Organize how the product is produced, assembled, checked, maintained and handled over time.

After

The final report can become a complete product specification package plus a user-facing webpage or app.

Key idea: the final project is not only a render. It must explain production logic and communicate the product clearly.

Session 6 deliverable

Production Manual, Sustainability, Life Cycle and Digital Output Report

#	Section	What must create
01	Production overview	How the product could be manufactured.
02	Production flow	Steps from material sourcing to finished product.
03	Assembly + quality control	How parts are joined and checked.
04	Maintenance + repair	How the user cleans, stores, repairs or replaces parts.
05	Sustainability + life cycle	How the product reduces waste and what happens at end of life.
06	Digital output	Website, GitHub Pages, app mockup or Expo Go prototype.

Suggested length: 6–10 pages. Use images, tables, diagrams and short captions.

Production flow

Must explain the sequence, not just list materials.

1 Source materials

materials, hardware, suppliers

2 Make parts

cut, sew, print, mold, CNC,
weld

3 Assemble

join parts, modules, fasteners

4 Test

load, fit, leak, comfort,
function

5 Inspect

quality checklist before
delivery

6 Maintain

clean, replace, repair, recycle

Maintenance, repair and life cycle

A robust product must explain what happens after the user buys it.

Maintenance

How to clean, store, dry, charge, wash, lubricate or protect the product.

Repair / replacement

Which parts can be replaced instead of discarding the entire product.

Life cycle

Material sourcing, manufacturing, distribution, use, maintenance and end of life.

Stage	Question to answer
Material sourcing	Where do materials or parts come from?
Use phase	How long should it last and how is it maintained?
Repair phase	What can be replaced, reused or upgraded?
End of life	What can be recycled, separated, returned or disposed?

Digital output options

The visual/commercial report can become a simple website, app mockup or digital page.

GitHub Pages

Best for publishing a simple public class/product website from a repository.

Expo Go

Best for testing a mobile app prototype on a phone without building a final app store version.

Notion / Google Sites / Canva

Best for fast digital dossiers when the focus is documentation and visual clarity.

How production content becomes digital content

Use the same evidence, but write it for a different audience.

Production / technical report	Website or app language
Ripstop nylon with reinforced stitching	Durable fabric made for daily movement
Replaceable buckle and modular strap system	Repairable parts that extend product life
Quality control: load and attachment test	Tested for secure everyday use
Maintenance: wipe clean and air dry	Easy to clean after daily use
End-of-life: disassemble textile and hardware	Designed to be repaired, reused or recycled

Do not copy the technical paragraph into the web/app. Translate it into user benefits.

NotebookLM prompt for Session 6

Use NotebookLM to draft the report, then edit and verify.

Using only the uploaded sources, create a Session 6 report titled “Production Manual, Sustainability and Life Cycle”.

Include: production overview, production flow, assembly sequence, tools and processes, quality control checklist, maintenance instructions, repair/replacement strategy, sustainability strategy, product life cycle, basic norms/references, missing information and next steps.

Also suggest how the same content can become a website, GitHub Pages page, Expo Go app prototype or digital dossier.

Do not invent final data. If information is missing, write “to be defined”, “needs supplier”, “needs testing” or “needs evidence”.

What to submit for Session 6

A concise report fragment that can be integrated into the final report.

#	Checklist
01	Cover / header with project name and main image
02	Production overview and production flow
03	Assembly sequence and tools/processes
04	Quality control checklist
05	Maintenance, repair and replacement strategy
06	Sustainability strategy and life cycle diagram
07	Digital output plan: website, GitHub Pages, app or dossier
08	Missing information and next steps
